# Linux Environment Variable

1. State the command for the following.

   a. view current environment variables

   **Ans:** printenv or env is to view current environment variables.

   b. display the PATH environment variable value

   **Ans:** echo $PATH is to display the PATH environment variable.

   c. update PATH to include the path to your home directory

   **Ans:** export PATH=$HOME:$PATH

2. How will you make the environment changes applicable to all users? Which script is to be modified?

**Ans:** sudo nano /etc/profile

3. I have installed an application named "myapp". After installation, if I invoke the application, it fails with error as "Command myapp not found". How will you fix this?

**Ans:** add the location of application to the PATH
